

300kW generator room air intake and exhaust requirements

Overview

This article addresses engine room ventilation considerations that apply to the successful installation, operation and maintenance of Caterpillar engines, generator sets, compressor units, and other packaged units. from a few kW to several MWs, in open and enclosed configurations. Open packages are usually installed inside a building or beneath a canopied structure to protect them from the elements. Enclosed generators are generally specified for applications where the generator system is to be installed. Like ICE-powered automobiles, ICE electrical generator systems have radiators and exhaust systems that reject heat. For example, a 10 kW generator will require significantly more airflow than a 2 kW portable unit. Ventilation is typically done through the use of an air inlet, air outlet/exhaust fan, and/or other ventilation openings. When ever possible, face the generator.
