This document describes the networking architecture, communication logic, operation and maintenance (O&M) methods, installation, cable connection, check and preparation before power-on, and system commissioning, power-of, and power-on operations of the commercial and industrial (C&I). This document describes the networking architecture, communication logic, operation and maintenance (O&M) methods, installation, cable connection, check and preparation before power-on, and system commissioning, power-of, and power-on operations of the commercial and industrial (C&I). Eaton's microgrid energy systems (MES) help companies facilitate electrical energy savings, resiliency and independence from a utility. By integrating multiple distributed energy resources (DER) on a common microgrid structure, users gain a reliable, scalable and efficient solution to unexpected. Smart Loads are loads that the user wants to intelligently, strategically, and automatically enable and disable for the purposes of Load Shedding and Power Shedding in order to maximize Time of Use savings, O-Grid operation, or maximize or minimize power sold back to the grid. Load Shedding allows. Historically all power flowed from transmission to distribution, distributed generation is creating potential bi-directional power flows and forcing utilities to implement more intelligent distribution networks. What is a Microgrid?

v Group of interconnected loads and distributed energy resources. ZMQ2E dual power auto transfer switch (hereinafter called ATS), is suitable for operating in the power system of AC 50Hz, rated operating voltage 400V, rated current 63A and below, to perform the shift between two power sources according to the requirement. The product has the protection functions. remote area, every microgrid is designed to support an electric or thermal load. A wide ange of distributed energy sources can be installed to optimize load management.
