

# Area of photovoltaic panels used in rural areas

## Overview

---

As shown in Map 1, roughly 18% of ground-mounted PV facilities in the U.S. were installed between 2021 and 2023, with a notable portion of these projects built on former cropland or pasture in rural areas. Across the country, solar farms have experienced rapid growth, supported by advancements in technology, cost reductions, and policy initiatives such as state-level renewable portfolio standards and tax credits. Department of Energy research projects solar energy to rise from 4% of our nation's total energy production to 45% by 2050, potentially requiring nearly 10.4 million acres of land in solar production (an area about 30% larger than the state of Maryland).<sup>1</sup> Without intervention, this landscape-scale change could have major impacts on the future of farming and food. Solar panels have emerged as a sustainable and reliable power source, particularly in rural areas where access to electricity may be limited. It offers energy independence to regions often overlooked by traditional power grids. Installing solar panels gives households direct access to clean energy, promoting.
