

# Cause of short circuit in Egypt s base station energy management system

## Overview

---

This crisis is rooted in a combination of declining gas production and rapidly increasing energy demand, creating a perfect storm that threatens to undermine Egypt's economic stability and social cohesion. Instead, the government is pursuing a multi-pronged approach: importing liquefied natural gas (LNG), reactivating emergency fuel sources such as mazut, negotiating with key partners like Israel, and accelerating long-term investments in renewable energy and international contracts. Egypt faces an. Since mid-July 2023, Egypt has been experiencing a power outage crisis amid increasing temperatures resulting from climate change and increasing consumption rates in light of the population increase of about 105 million citizens, in addition to other imbalances in the energy sector. The primary cause of the nation's energy woes has been a severe reduction in domestic gas production. Gas production dropped 9 percent from January to May of this year compared to last. The global heatwave has caused electricity cuts and power shortages as demand for cooling goes up.
