

Causes of lithium battery energy storage system explosion

Overview

Thermal runaway is the primary root cause of fire and explosion incidents in lithium-ion battery energy storage systems. Lithium-ion battery energy storage systems, with their outstanding advantages of high energy density, fast response speed, and long cycle life, have become a key technology for solving renewable energy integration issues and enhancing grid stability. They are widely applied in generation-side. Battery energy storage systems (BESS) stabilize the electrical grid, ensuring a steady flow of power to homes and businesses regardless of fluctuations from varied energy sources or other disruptions. However, fires at some BESS installations have caused concern in communities considering BESS as a.
