Overview

The task of distribution system restoration (DSR) is initiated after the post-outage status of the distribution grid has been assessed. Operators traditionally resort to network reconfiguration schemes to limit the impact of an outage while satisfying operational and design. Authorized by Section 40101(d) of the Bipartisan Infrastructure Law (BIL), the Grid Resilience State and Tribal Formula Grants program is designed to strengthen and modernize America's power grid against wildfires, extreme weather, and other natural disasters that are exacerbated by the climate. Consumers turn up, down or shift their usage in response to external signals such as time-of-use prices, dynamic tariffs or direct requests from a grid operator, often earning incentives or bill savings in return. Unlike energy efficiency, DSR is not about using less energy overall but about using. It rewards businesses and consumers that adjust their electricity use in response to grid conditions driving cost savings, grid stability, and decarbonisation. In this article we explore trends in the DSR space and practical insights for 2025 and beyond. Coalition stakeholders include the City of Oakridge, South Willamette Solutions, Lane County, Oakridge Westfir Area Chamber of Commerce, Good Company/Parametrix, Oakridge Trails. An Introduction to Microgrid Systems Within the commercial and industrial renewable energy sector, few terms have garnered more attention lately than the system label 'microgrid'. The integration of grid sensors, remote controls, and distributed generators (DG) brings about exciting opportunities in DSR.
