

Exhaust of the generator room

Overview

Exhaust vents belong higher to let hot air escape. This article addresses engine room ventilation considerations that apply to the successful installation, operation and maintenance of Caterpillar engines, generator sets, compressor units, and other packaged units. The elevated temperature results in increased. Designing ventilation for a generator or transformer room is one of those things that practically every MEP engineer has to do at some point or another in their careers. The rooms are very hot, and without proper ventilation, internal equipment can fail, overheat, or even create safety hazards. Ventilation is typically done through the use of an air inlet, air outlet/exhaust fan, and/or other ventilation openings. When ever possible, face the generator. The use of gas fired, and diesel fueled generators for back-up power and co-generation is increasing due to a higher demand on the current electrical infrastructure, the growing need for backup power and the necessity to improve overall efficiency to ensure uninterrupted power.
