

# High-speed flywheel energy storage system

## Overview

---

Flywheel storage systems represent a high-speed, efficient, and environmentally friendly energy storage solution. Their unique characteristics make them well-suited for a range of applications, from grid stabilization to uninterruptible power supplies. Flywheel energy storage (FES) works by spinning a rotor (flywheel) and maintaining the energy in the system as rotational energy. When energy is extracted from the system, the flywheel's rotational speed is reduced as a consequence of the principle of conservation of energy; adding energy to the system increases its rotational speed when there is no demand from electricity users. A flywheel energy storage system intended for supporting alternative autonomous sources shall exhibit very high energy efficiency (due to the necessity of long accumulation time) and three-phase output with possibility for unbalanced load at constant. Compact, durable motors that can operate at high speeds without overheating could increase the energy efficiency of a wide range of devices. We showed theoretically and experimentally that with the right controller you can make this system stable by controlling movement along just one axis. At its core, a flywheel storage system is a mechanical device designed to store rotational energy. Flywheel energy storage systems (FESS) are summarized, showing the potential of axial-flux permanent-magnet (AFPM) machines in such applications.
