

How much water can a locker hold

Overview

How Much Water Should You Store?

According to FEMA and the American Red Cross: Minimum: 1 gallon per person per day ($\frac{1}{2}$ gallon drinking, $\frac{1}{2}$ for hygiene). Duration: At least 14 days stored; 30+ days for true. However, wet area lockers are designed to resist damage caused by moisture. Moisture often facilitates the build-up of germs and bacteria which cause diseases. The storage capacity of a locker is determined by various factors, including its dimensions, intended purpose, and design specifications. Typical dimensions for standard lockers might range from 12 inches wide to 18 inches deep, providing a storage volume. Long term water storage is one of the most important parts of emergency preparedness. Without a dependable supply of clean water, survival becomes nearly impossible after just a few days. Fortunately, there are many options that make it possible, affordable, and even easy to store large amounts of water. However, because most people use more than a gallon per day and water outages can last a long time, it is better to aim for a minimum of 60-120 gallons per person. What is a Water Volume Calculator?

A.
