

# How often does the mobile communicate with the base station

## Overview

---

The mobile device continuously monitors the signal strength from its current base station and surrounding base stations. Base stations, also known as cell sites, are localized hubs within a mobile network. Its main functions are modulation and demodulation of signals, and RF transmission and reception. The signals are sent to and received from antennas that are attached to radio transmitters and receivers, commonly referred to as mobile phone base stations. Cellular networks operate on different frequency bands, which are divided into channels.
