## Overview

---

This is caused by low intermediate circuit DC voltage. This can be caused by a missing supply voltage phase from a blown fuse or faulty isolator or contactor or internal rectifier bridge fault or simply low mains voltage. POSSIBLE FIXES: Check mains supply and fuses. POSSIBLE FIXES: Turn the overvoltage controller is. Inverters, which convert direct current (DC) to alternating current (AC), are critical components in various applications, including renewable energy systems, uninterruptible power supplies (UPS), and industrial motor drives. However, like any electronic device, inverters can experience faults. My country's standard mains voltage is around 220 to 230V AC. I have noticed that some cell phone charger SMPS connected to the inverter has damaged with big bang (blast) back to back in past days. With a CCTV camera and a router load, its output is around 275V AC and with a desktop PC and a laser. At which point the BMS disconnects the charging side of the battery which causes a momentary jump in voltage or split second, this temporary increase in voltage that lasts until the charge controllers recognize the full state of charge My thought is that this is not noticed when I'm actually. If your inverter keeps switching on and off then you might start wondering if it is because of some damage.
