

# Iron-lithium battery energy storage construction

## Overview

---

The discovery involves making an iron-based cathode material repeatedly donate and accept five electrons instead of the usual two or three, significantly increasing rechargeable energy storage potential. Israeli special minerals company ICL started construction of a lithium iron phosphate (LFP) battery plant in the US to supply energy storage and electric vehicle manufacturers. The St Louis, Missouri-area plant would produce up to 30,000 metric tonnes (t)/yr of LFP and is expected to be operational. Researchers have created a more energy dense storage material for iron-based batteries. The breakthrough could also improve applications in MRI technology and magnetic levitation. Both cell types argue part on how rapidly costs continue to fall.
