Overview

A new study shows that solar panels installed in the 1980s and early 1990s are still producing electricity today — more than 30 years later. Researchers from. In the late 1980s, when Switzerland was just beginning to experiment with solar power, engineers bolted a few shiny panels onto rooftops, mountain stations, and even utility-scale farms. When we think about solar panels installed in the 1990s, the image that comes to mind is often that of outdated, inefficient technology, good at best for energy. What happens when the solar panels powering your home or business reach the end of their useful life?

This question becomes more pressing as numerous panels installed during the early solar boom are nearing retirement. Solar panels typically last 25-30 years before their efficiency significantly. A decade-old panel still delivers 90-95% of its original power output.
