

Photovoltaic panels have built-in electric field energy sources

Overview

Solar technologies convert sunlight into electrical energy either through photovoltaic (PV) panels or through mirrors that concentrate solar radiation. A photovoltaic (PV) cell, commonly called a solar cell, is a nonmechanical device that converts sunlight directly into electricity. These cells are made of semiconductor materials, typically silicon, that have the unique ability to absorb photons from sunlight and. Once an exotic technology used almost exclusively on satellites in space, photo- voltaics has come down to Earth to find rapidly ex- panding energy markets. Many thousands of PY sys- terns have been installed around the globe. Ultraviolet (UV) radiation - UV has higher energy than visible light. The overwhelming majority of solar cells are fabricated from silicon —with increasing efficiency and lowering cost as the materials range from amorphous (noncrystalline) to.
