

Power generation used by solar power stations

Overview

A solar photovoltaic (PV) power plant is an innovative energy solution that converts sunlight into electricity using the photovoltaic effect. This process occurs when photons from sunlight strike a material, typically silicon, and displace electrons, generating a direct current. At the heart of any solar power station lies its most iconic component: the solar panel. The two dissimilar semiconductors possess a natural difference in electric potential (voltage), which causes the electrons to flow through the external circuit, supplying power to the load.
