

Something used to generate electricity

Overview

Electricity is most often generated at a power plant by electromechanical generators, primarily driven by heat engines fueled by combustion or nuclear fission, but also by other means such as the kinetic energy of flowing water and wind. For utilities in the electric power industry, it is the stage prior to its delivery (transmission, distribution, etc.) to end users or its storage, using for example, the pumped-storage method. There are many different types of electricity generators. He found that moving a magnet inside a coil of. Electric power generation is typically a two-step process in which heat boils water; the energy from the steam turns a turbine, which in turn spins a generator, creating electricity.
