This paper presents the development of a flexible hourly day-ahead power dispatch architecture for distributed energy resources in microgrids, with cost-based or demand-based operation, built up in a multi-class Python environment with SQLAlchemy and InfluxDB databases storing the dispatcher and. Presentation was intended to build foundational understanding of energy resilience, reliability, and microgrids. Where there is an energy shortfall or supply costs are high, then energy may be drawn from storage, and non-critical loads can be temporarily curtailed until the supply profile recovers. Minimal losses from conversion of distribution mean that characteristics and. This paper proposes a multi-strategy fusion slime mould algorithm (MFSMA) to tackle the microgrid optimal dispatching problem. Traditional swarm intelligence algorithms suffer from slow convergence, low efficiency, and the risk of falling into local optima. The MFSMA employs reverse learning to.
