

# The higher the inverter frequency the higher the voltage

## Overview

---

These inverters use the pulse-width modification method: switching currents at high frequency, and for variable periods of time. In the world of solar energy, the photovoltaic (PV) inverter is the heart of the system. In most regions, the standard inverter frequency for AC power systems is 50 or 60 Hz, representing the number of complete cycles per second. When the output voltage of the frequency converter is equal to the rated voltage, the minimum output frequency is called the basic. A high-frequency inverter is an electrical device that converts direct current (DC) into alternating current (AC) at a high switching frequency, typically above 20 kHz (Kilohertz), to achieve efficient power conversion and provide stable output. Power frequency inverters commonly.
