

The wind turbine blades will flip with the wind

Overview

Wind turbine blades naturally bend when pushed by strong winds, but high gusts that bow blades excessively and wind turbulence that flexes blades back and forth reduce their life span. Bend-twist-coupled blades twist as they bend. At first glance, wind turbines seem to rotate slowly—especially the massive wind blades. Yet, these low-speed giants can generate megawatts of power reliably. Why is that?

The answer lies in aerodynamic design, mechanical engineering, and power system integration. A great blade design?

That's where you get maximum power with. DOE-funded research led to wind turbine blade breakthroughs that provide more power at lower cost.
