

What is 1m photovoltaic panel used for

Higher Anti-Rust Performance
Lower Internal Impedance

Overview

It is used in constructing integrated photovoltaic power systems and as a semi-transparent photovoltaic glazing material that can be laminated into windows. It typically denotes "Light Module," a term that highlights the efficiency and weight attributes of solar panels. The PV cell is composed of semiconductor material; the "semi" means that it can conduct electricity better than an insulator but not as well as a good. These cells are built by depositing one or more thin layers or thin film (TF) of photovoltaic material on a substrate, such as glass, plastic, or metal. The thickness of the film varies from a few nanometers (nm) to tens of micrometers (μm). The film is much thinner than the first-generation.
